

Web hosting solutions

intro

REDtechnology.com web hosting can offer you the best of several worlds: as much or as little capacity as you need on leading-edge servers 24/7, the reassurance of comprehensive technical back-up and performance monitoring, plus genuine flexibility.

hostIT is the proven means of running websites, large databases and ecommerce activities that are tailored so closely to your needs, it's effectively like having your own state-of-the-art server centre and technical staff. The difference is, hostIT gives you access to the kit and the people which are worth £millions, for no more commitment than a fixed low monthly fee.

benefits

hostIT web hosting is flexible enough to be precisely what you need it to be – the servers are located in our purpose-built London Docklands facility, but for all intents and purposes, they become part of your organisation.

REDtechnology.com will allocate as much server capacity as you need to run your activities efficiently.

We will install whatever software you need – whether you're using coded Microsoft products or open source alternatives.

Applications such as epages, commerce server, exchange and sharepoint, for example – are easily installed, and ongoing monitoring means they will always run at optimum efficiency.

Security is a REDtechnology.com speciality. We have the technical people and the latest systems to ensure that our security standards meet or exceed your own.

We're adept at 'patching' security holes in applications. Likewise, we're always up to speed with protection against new viruses, and the best efforts of hackers.

REDtechnology.com also provides appropriate security in terms of firewalls, border routers and internet connections.

Your systems are constantly monitored, to make sure they are always running effectively and at optimum speed. Hardware is maintained by our own technical team.

Back ups are performed daily and weekly, plus for total peace of mind, monthly tapes are securely stored off-site.

Whenever you need to, you can contact our technical people directly – there's no call centre or non-technical service department to negotiate.

REDtechnology.com offers both developer and technical teams, so that applications and servers are maintained hand-in-hand, for maximum efficiency.

Email services and email forwarding are also be part of the hostIT package.

hostIT includes domain name services too, and REDtechnology.com is a domain name registrar.

Virtual Private Networks can be set up, providing dedicated encryption of data flow between your office and website.

How it works

Our purpose built data centre in London Docklands is the state-of-the-art core of the hostIT system

- > A highly secure location.
- > Resilient power to ensure reliability, stability and capacity.
